

HOME ENERGY AUDITS

Building guidelines recommend a Home Air-Tightness Test as the best way to accurately measure your home's protective envelope from the elements, and to truly understand its efficiency rating.

You can spend endlessly on energy efficiency upgrades and still have ventilation problems, not know where your home's leaks are, or understand how each repair might benefit your home.

A Complete Home Energy Audit, with Leak Detection Service, can determine exactly how tight your home is compared to acceptable standards, help pinpoint air-leaks, analyze your ventilation issues related to indoor air quality, and calculate monetary losses experienced from these inefficiencies.

In many cases we can start to address needed repairs while on-site, or develop a comprehensive plan for future home upgrades and improvements.
